1. G7 Shredding

Two batches of G7 were shred on a J-10 type shredder. The shreds were blended at Tobacco Development into Winston type formulas.

For one test, cigarettes were made on the 6-8-6 maker. In this series ~~1000~~ cigarettes which contained shredded G7, were 8% lighter in rod weight than controls. On a per cigarette basis the test cigarette gave about 15% less nicotine, F70 "Tin" and puffs than controls. However, on a per puff basis the nicotine and F70 "Tin" deliveries were similar.
